### 6.4 Electrodynamic forces

The table below shows an indication of suggested distances to keep between the breaker and the first fixing point of the conductor and bars

## DPX ${ }^{3} 125$ HP thermal magnetic circuit breakers <br> DPX³-I 125 HP switch disconnectors

Reference(s):
from 423600 to 4236 19; from 423640 to 4236 59; from 423680 to 423699 ; from 423700 to 4237 19; 4231 84; 4231 85;
in order to reduce the effects of the electrodynamic stresses that may be created during a short circuit. In the realization of anchorage system it is recommend the use of isolators suitable for the type of conductor used and the operating voltage.

| $\mathbf{I}_{\text {cc }}($ kA $)$ | Maximum Distance (mm) |
| :---: | :---: |
| 36 | 350 |
| 50 | 300 |
| 70 | 250 |
| 100 | 200 |

According to conductor type and bar system (except Legrand bar kits), the choice of the distance to keep is to be calibrated by the installer.
Also installer must take into account the weight of the conductors so that this does not affect the electrical junction between the conductor itself and the connection point.
