## General remarks on protection unit

The protection units S1 are normally supplied by the internal current transformers (CTs).
When the current flowing through the circuit breaker is greater than $12 \%$ of the maximum power ( $20 \%$ of In for single phase load), the internal current supply ensures all operation of the protection unit, included: LED status and diagnostic functions (e.g. trip test).
To ensure the same performance when the load is less than $12 \%$ of the maximum power ( $20 \%$ of $\ln$ for single phase load) to grant complete functions, the following optional power supply can be used:

- power supply temporarily connected to frontal Service port, connected to specific adapter for PC (Legrand use only)

Together with above protections, activated in case of electric faults, the trip unit also integrates self-protection for:

- Over temperature : in case the internal temperature of protection unit exceed $95^{\circ} \mathrm{C}$;
- Auto diagnostics: in case embedded watchdog circuit detects internal malfunctions, which could compromise the correct working of microcontroller.

from 423250 to 4232 53; from 423255 to 4232 58;

### 6.4 Electrodynamic forces

The table below shows an indication of suggested distances to keep between the breaker and the first fixing point of the conductor and bars in order to reduce the effects of the electrodynamic stresses that may be created during a short circuit. In the realization of anchorage system it is recommend the use of isolators suitable for the type of conductor used and the operating voltage

| $\mathbf{I}_{\mathrm{cc}}$ (kA) | Maximum Distance (mm) |
| :---: | :---: |
| 36 | 350 |
| 50 | 300 |
| 70 | 250 |
| 100 | 200 |

According to conductor type and bar system (except Legrand bar kits), the choice of the distance to keep is to be calibrated by the installer.

Also installer must take into account the weight of the conductors so that this does not affect the electrical junction between the conductor itself and the connection point.

### 6.5 Power losses per pole under $\mathrm{In}^{n}$
