## DMX-SP 4000

## 1. Weights

It is important to know the weight of the breaker for proper selection of handling equipment. Net Weight.

## Circuit breakers

| Fixed | Rating (A) | $\mathbf{3 2 0 0 / 4 0 0 0}$ |
| :--- | :---: | :---: |
|  | $3 P$ | 59 kg |
|  | 4 P | 76 kg |
|  | $3 P$ | 66 kg |
|  | 4 P | 84 kg |

## Switch disconnectors

| Fixed | Rating (A) | $\mathbf{3 2 0 0 / 4 0 0 0}$ |
| :--- | :---: | :---: |
|  | $3 P$ | 57 kg |
| Draw-out | 4 P | 73 kg |
|  | $3 P$ | 64 kg |
|  | 4 P | 81 kg |

## 2. Handling and unpacking

The breaker can be transported using a fork lift.

## DMX-SP 4000

Remove breaker mounting screws.

## DMX-SP 4000

A special lifting handle are available (optional 0288 79) to facilitate handling.

## DMX-SP 4000

DMX-SP 4000 3P breakers (fixed and draw-out version) can also be transported by 2 persons.

## DMX-SP 4000

3. Storage for fixed and draw-out breakers

When Base and Breaker are not being used for a long time, pack them.

Store the breaker in a cool, dry place, away from dusty/corrosive environment.
 dry place,

Do not stack more than 2 breakers one above the other.

## 7. Operating

Before installing the breaker, follow the following operations. Initially, the Breaker is O and Spring is dishanasea.

Charge the Main spring through multiple strokes of charging handle.
Now the breaker is O and spring is charged.

## DMX-SP 4000

Push 'ON' button to close the breaker. Now, the breaker is I and spring is dischaseas. In this situation, spring can be charged again for next operation.

Push 'OFF' button to trip the breaker.
Now, the Breaker is O and Spring is distenaged

## DMX-SP 4000

## DMX-SP 4000

## 9. Features of the main electrical accessories

## Motor operator

## Technical features

Rated operating voltage Uc (Va.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}-400 \mathrm{~V} \div 440 \mathrm{~V}-480 \mathrm{~V}$
(Vd.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}$
Voltage range (\% Uc): 85 $\div 110$
Maximum power consumption (W/VA): 180/180
Maximum peak current for about 80 ms : $2 \div 3 \times \mathrm{ln}$
Charging time (s): 5
Operating frequency ( $\left.\mathrm{n}^{\circ} / \mathrm{min}\right): 2$

## Closing coil

Technical features
Rated operating voltage Uc (Va.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}-415 \mathrm{~V} / 440 \mathrm{~V} / 480 \mathrm{~V}$
(Vd.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}$
Voltage range (\% Uc): $85 \div 110$
Pick-up consumption (W/VA): 500/500
Pick-up time (ms): 180
Hold consumption (W/VA): 5/5
Closing time (ms): 50
Isolation voltage (kV): 2,5

## Shunt trip

Technical features
Rated operating voltage Uc (Va.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}-415 \mathrm{~V} / 440 \mathrm{~V} / 480 \mathrm{~V}$ (Vd.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}$
Voltage range (\% Uc): 70 $\div 110$
Pick-up consumption (W/VA): 500/500
Pick-up time (ms): 180
Hold consumption (W/VA): 5/5
Opening time (ms): 30
Isolation voltage (kV): 2,5

## Undervoltage release

Technical features
Rated operating voltage Uc (Va.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}-415 \mathrm{~V} / 440 \mathrm{~V} / 480 \mathrm{~V}$ (Vd.c.) $50 / 60 \mathrm{~Hz}: 24 \mathrm{~V}-48 \mathrm{~V}-110 \mathrm{~V} \div 130 \mathrm{~V}-220 \mathrm{~V} \div 250 \mathrm{~V}$
Voltage range (\% Uc): $85 \div 110$
Pick-up consumption (W/VA): 500/500
Pick-up time (ms): 180
Hold consumption (W/VA): 5/5
Opening time (ms): 60
Isolation voltage (kV): 2,5

## DMX-SP 4000

```
Time delayer for undervoltage release
Technical features
Case: }2\mathrm{ modules
Rated operating voltage Uc (Va.c. - Vd.c.): 110V-230V
Input supply:
110Vdc 85% - 110%
110Vac 85% - 110% 50/60 Hz
Pick-up consumption: 16,5 VA -W
Hold consumption: 5 VA-W
230Vdc 85% - 110%
230Vac 85%-110%,50-60 Hz
Pick-up consumption: 34,5 VA -W
Hold consumption: }10\mathrm{ VA-W
Opening threshold: 0,35\div0,7 Uc
Closing threshold: 0,85 Uc
Time-delay for each module: 1 s at Un lis possible to connect up to 3 modules - 1s of delay for
each one module installed)
Operating temperature: (-10) - (+55) *}\textrm{C
```

## Signal contact for auxiliaries

Technical features
Rated operating voltage Uc (Va.c.): 250 V 16A
(Vd.c.): $250 \mathrm{~V} 0,3 \mathrm{~A}$

## Additional signalling contact

Technical features
Rated operating voltage Uc (Va.c.): 250V 16A
(Vd.c.): $250 \mathrm{~V} 0,3 \mathrm{~A}$

## Contact ready to close with charged springs

Technical features
Rated operating voltage Uc (Va.c.): 250V 16A

## DMX-SP 4000

Inserted/test/draw-out contacts<br>Technical features<br>Rated operating voltage Uc (Va.c.): 250V 16A<br>$$
\text { (Vd.c.): } 250 \mathrm{~V} 0,3 \mathrm{~A}
$$

## Module programmable output

Technical features
Case: 9 modules
Input supply: $50 / 60 \mathrm{~Hz}$; $24 \mathrm{Va.c}+./-10 \% ; 24 \mathrm{Vd.c}+./-10 \%$
Contact rated current:
AC 250V 8A
DC 30V - 8A; 110 V - 0,3A; 220V - 0, 12 A
Operating temperature: $(-10)-(+55)^{\circ} \mathrm{C}$

## External auxiliary supply

Technical features
Case: 2 modules
Input supply: 50-60 Hz; $24 \mathrm{Va.c}+./-10 \% ; 24 \mathrm{Vd.c}+./-10 \%$
Input power supply (W/VA) $\geq 5$
Operating temperature: $(-10)-(+55)^{\circ} \mathrm{C}$
$N^{\circ} 1$ module is suitable to supply no more than $n^{\circ} 4$ MP2/MP4 protection unit.

## Trip contact (factory fitted only)

Technical features
Rated operating voltage Uc (Va.c.): 250V 6A

## DMX-SP 4000

## 10. Installation and door cut-out

Tipical installation of DMX-SP 4000 breakers in an enclosure.

## DMX-SP 4000

10.1 Installation of breaker DMX-SP 4000 fixed version

## DMX-SP 4000

4 poles flat terminals.

Horizontal Terminals.

Vertical Terminals.

## DMX-SP 4000

Horizontal COMB terminals.

Vertical COMB terminals.

## DMX-SP 4000

13. Connection for fixed version

Termination support must be made of isolating material and sized according to the bars in order to avoid excessive stresses during short circuit conditions.

## DMX-SP 4000

## 14. Possible connections for draw-out version

DMX-SP 4000's terminals offer more contact area to accept Aluminium links.
DMX-SP 4000's Universal Flat terminals greatly facilitate termination.

These terminals directly support all commonly used types of termination as shown in adjoining figure.

Termination support must be made of isolating material and sized according to the bars in order to avoid excessive stresses during short circuit conditions.

## DMX-SP 4000

Installation of Terminal Adaptor available as an accessory.

## DMX-SP 4000

## 15. Ground connection

To realize ground connection, use suitable hole, fixing the cable lug with the bolt M10 delivered with the breaker.

## DMX-SP 4000

## 16. Insertion on switchboard

Pull-out the Base Rail and ensure that the breaker is in isolated position (see position indicator).

A special lifting handle are available (optional 0288 79) to facilitate handling. Only DMX-SP 4000-3P breakers
can also be transported by 2 persons. Ensure that Breaker rests correctly in 2 slots on either side of cradle rail.

Improper loading of breaker may lead to personal injury and damage to product.

## DMX-SP 4000

Gently push the breaker to Isolated position and close the Panel door. If equipped with Rating Mis insertion
device (optional O 288 25), base will not accept breaker of different rating.

Press the OFF button and then open the Racking Shutter.

When the breaker is connected to live bus, the racking-out operation must be done only by specialized personnel.

Excessive forceful racking-in beyond Service position may lead to product damage.

## DMX-SP 4000

17. Auxiliary ferminals block

## DMX-SP 4000

### 17.1 Shunt trip (ST)

Allows to open the breaker with an electrical signal. According to the features of the device, it's always possible to open the breaker (when closed). The shunt trip can work (depending on type) both on AC and DC current.
This device can work with an instantaneous supply, but works also with a continuous one.

If always supplied, the device is like an electrical lock in open position.
Some applications need an high safety on the open command, and, particularly, the duplication of the command circuit by a double shunt trip. In that cases the second shunt trip can be placed instead of the UVR device.

## DMX-SP 4000

## 18. New cabling system

New automatic "Cage Clamps".
Constant press on cable guarantee maximum contact during time.
This is the solution to the problem of screw with $1 / 2$ turn. Shape form of spring avoid the problem of incision of insulation.

1. Put the screw: the clamp open.
2. Put the cable.
3. Extract the screw: clamp automatically lock the cable. Detail: Electrical contact is guaranteed with max flexible cable diameter up to $2,5 \mathrm{~mm}^{2}$, also with two cable of different sections.

To have a major order and safety when cabling operations are done, the draw-out version of the

DMX-SP 4000 has several buttonholes usefull to collect all the cables with cable ties as shown.

## 20. Setting protection unit

### 20.1 Insertion/substitution battery

Remove frontal cover of the breaker. Insert the 4 keeping polarity and mounting order like shown on batteries on the lower part of the protection unit picture. Batteries are delivered outside the breaker.

### 20.2 Setting levels protection

Setting of levels protection is possibile with rotary switches. Execute setting with a plate screwdriver.

For informations about setting protection unit see the related instruction sheet.

### 20.3 Setting data/time (if available)

Important: in order to archive data concerning possible faults, we suggest to set up the date/time
of protection unit. For setting, consult the protection unit manual.

## DMX-SP 4000

### 20.4 Seal of protection unit

Check settings through the display menu (if available).
Close the cover of the protection unit, this can be sealed through a normal plumbing.

## DMX-SP 4000

## 21. Standard functions of the breaker

For use with automatic change over systems (with feedback function) set the reset button in MAN position.

### 21.1 Reset button

## MAN position.

Default setting for a new product.
In this position it's possible to prevent the closing after a trip commanded by protection unit (button ejected).
When this function is selected, the operator must insert the button before to close again the breaker.

## AUT position.

Mostly used in monitoring systems.
In this position the breaker can be always closed after a trip commanded by protection unit (button remains inserted).
Breaker will be always ready to close when its status is like this:
O charged.

NB: In order to set the button in AUT position:
1 . Push the button until the end with a flat screwdriver.
2. Pushing, turn the selector $90^{\circ}$ in AUT position.

## DMX-SP 4000

### 21.1.1 Trip contact if available (factory fitted only)

The trip contact ("C TR" in auxiliary terminals block) (AUT/MAN), as shown in the following diagram: working depends on reset button mode setting

| TR |  |
| :---: | :---: |
| 51 |  |
|  | 54 |
|  |  |

Technical features of trip contact: change over contact (C-NO-NC), 250V, 6A MAX.

### 21.2 Padlock for racking shutter

Only for draw-out version.
racking shutter with lock of $5 / 8 \varnothing \mathrm{~mm}$ (up to three).
When is isolated position $\boldsymbol{\rightarrow}$ ) is possible to lock the This way it's impossible to insert the racking handle,

## DMX-SP 4000

## 22. DMX-SP 4000 start up

## Operator checks

The operator must verify that the device has been properly installed inside the distribution cabinet and that all the installation conditions are correct without any mistake due to negligence or not proper objects inside, according to the current standards.

Start up checks are classified in:

- Without voltage checks
- Under voltage checks

## Without voltage checks

Distribution center inspection:

- To verify that the device installation is performed according to the instructions of this user manual.
- To verify the device wiring using proper screws and terminals.
- To verify that no metallic parts, tools and manufacturing scraps are close to the device.

Fastening torque of the terminals
$\varnothing$ Nominal (mm): 10 (screw M10)
$\varnothing$ Hole (mm): 11
Fastening torque ( Nm ) with plate or split washers: 37.5
Fastening torque (Nm) with contact washers: 50

Fastening torque of the terminals
$\varnothing$ Nominal (mm): 10 (screw M10)
$\varnothing$ Hole (mm): 11
Fastening torque ( Nm ) with plate or split washers: 37.5 Fastening torque (Nm) with contact washers: 50

- To verify that the device is not damaged outside and there are not missing parts that can be the cause of wrong working.

## Check of installed components correspondence to the electric diagram:

- To verify that the device specifications are according to the technical requests.
- To verify that the protection unit specifications (where it is needed) are according to the technical requests and all the settings are correct. To check the protection unit setting parameters, please see the specific user manual.
- Insert / verify the batteries and their level
- Set the protection unit
- Performe the TEST procedure through the $T$ button on the protection unit
- Set back the reset button in MAN position

## DMX-SP 4000

- Tripping test check
keep pushing $T$ button longer than 2 sec and verify that:
all leds light on for 1 second (ON LED on orange, the others on red);
the device trips;
the display shows that the device has tripped; RESET button has been released.
- To reset the device, push RESET button and set it back (see protection unit user manual)
- To verify that all the accessories specifications are consistent with the auxiliary circuit voltage and the electric diagram

## Functioning check

- To verify the device mechanical functioning, contacts opening and closing
- In case of devices with mechanical interlock, to verify that the functioning logic is according to the needs based on the interlock diagram
- Manual control
- To performe at least two opening/closing cicles

- To verify the lock systems, if any (open position, draw-out position...)

## Auxialiries wiring and installation check

- To verify the auxiliary circuits proper installation
- To verity the correspondence of the terminals wiring
- To verify the correspondence of the auxiliary circuit wiring.

## How to resume the device after tripping

In case during the functioning the breaker trips, the assigned personnel must respect the following procedure:

- To indentify the reason of the release and if it is related to a protection event or an external circuit
- To check the protection unit history log (see the protection unit user manual).
- To verify the position of MAN/AUT button. If it is in MAN position after the protection unit tripping, the RESET button is released and, to assure more safety, it's impossible to close the breaker. In this case the personnel must understand the reason of the fault and set back the RESET button before start working again.
- If the button is in AUT position the device is able to close even after a protection tripping, without any on site intervention of personnel, allowing the closing by remote if needed by the system manager. In this case an automatic and remote system is needed.

## Identification of the fault

The fault is shown locally on the protection unit and/ or by the auxiliary contacts installed on the device. In case of fault it is strongly suggested to inspect the device (see Maintenance guide).

## Reasons fault

The device shouldn't be closed again before checking and solving the cause of the fault (locally or by remote).
The reasons may be various:
the reasons may be classified in two main types

- fault protection (see the hystory log of the protection unit)
- ST and UVR intervention

After checking the reason of the fault, before closing the device again, it's suggested to check the device conditions, and above all, to check the dielectric and insulation conditions of one part or the whole device depending on the nature of the tripping event.
Those checks and tests must be requested and managed by qualified personnel according to this user manual.

## DMX-SP 4000

## In case of short circuit, device inspection

In case of short circuit protection, go to Maintenance guide and check the following conditions:

- to check the arc chamber conditions and the wear status
- to check the contacts status
- to check the clamping of the power connections and the auxiliary circuit connections as shown in the Start UP chapter
- in case of draw-out version device, take out the breaker and check the insertion clamps and the inside conditions

## Device closing

The closing of the breaker can be performed locally or by remote only after checking that the system and the device conditions are consistant with the safety procedure.

## DMX-SP 4000

| Object | Check |
| :--- | :--- |
| Manual control | To performe at least two opening/ <br> closing cicles |
| Draw-out cell | To performe at least one cycle <br> insert/test/draw out postion |
| Motor operator | Supply the motor operator <br> and perform at least 2 cycles <br> opening/closing. The motor <br> operator must load the springs after <br> each opening/closing event and <br> stop when the springs are ready |
| Aux contacts and alarms | To verify the correct signals |
| Insert/draw-out contacts | To verify the correct signals |
| Shunt trip coil | Close the breaker <br> Supply the coil and verify <br> the tripping |
| Closing coil | Open the breaker <br> Supply the coil and verify <br> the closing |
| Cable interlock | Cut the UVR power and check the <br> Creaker tripping. <br> To verify that it's impossibile <br> to close the breaker without UVR <br> power. |
| To verify the proper functioning |  |

## 23. Ordinary maintenance

An ordinary maintenance, performed with its - main contacts;
respective frequency, is important in order to:

- check and maintain the efficiency of the product;
- identify parts/accessories damaged;
- prevent emergencies.

Periodical check and maintenance is recommended on the following parts:

- mechanism;
- anti-shock opening spring;
- arc chutes;
- draw-out system (if present);
- terminals;
- auxiliary;
- mechanical accessories (if present);
- electrical accessories (if present);
- trip unit.

For more details concerning maintenance procedures and their frequencies, consult the DMX-SP 4000 maintenance guide.

## DMX-SP 4000

## 24. Basic trouble shooting

| Stituation | Probability | Solution |
| :---: | :---: | :---: |
| ACB does not close on pressing "ON" button | $\mathrm{U} / \mathrm{V}$ release is present but not energized | Energize U/V release |
|  | Mechanism spring is not charged | Charge the mechanism spring manually till a distinct sound is heard \& indicator turns yellow |
|  | Reset button ejected | Press reset button |
|  | Racking Shulter is open | Close Racking Shutter |
|  | Mechanical Interlock disables closing | Re -check before attempting to close the breaker |
| Racking shutter does not re-close automatically after racking handle is pulled out | Breaker is in-between Service/Test/Isolated position. Position indicator is not aligned with any of the positions | Rack in or out the breaker to any of the distinct positions |
| Draw-out version breaker cannot be racked-in after isolated position | Breaker \& Mis-insertion device ratings do not match | Put correct breaker |
| Racking Shutter does not open | ACB is closed | Keep on pushing the OFF button |
| ACB does not close electrically | Electrical antipumping is active | Interrupt 'OPEN' command once |
|  | "Ready to close" (RTC) conditions are not met | Check all RTC conditions |
| ACB trips after closing | Overload fault exists if tripping is after several seconds or minutes. Other fault(s) exist if tripping is within a second | Check the unit protection and identify the fault then clear the cause |
|  | Shunt Release is getting command continuously | Check the source of command |

For a more detailed trouble shooting, consult the DMX-SP 4000 maintenance guide
