MAPS AND COMMANDS FOR LEGRAND ELECTRONIC CIRCUIT BREAKERS DMX^3 AND DPX^3

Revision of the present document:

REVISION: 1.0.0
DATE: 17/12/2024

Product involved:

- DMX^3 1600/2500/4000/6300 MP2/MP4
- DMX^3 4000 1000V MP2/MP4
- DMX-SP 2500/4000 MP2/MP4
- DPX^3 630/1600 S10
- DPX^3 250HP S10
- DPX^3 250 S2/Sg
- DPX^3/EMS interface

Revisions:

GENERAL INFORMATION

MODBUS OVER SERIAL DETAILS

Physical Layer	Standard EIA/TIA 485 (RS-485) two-wire configuration
Device Addressing	1÷247 (1 default)
Trasmission Modes	RTU / ASCII (RTU default)
Baud Rates (bit/s)	Programmable 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200 (19200 default)
Data Bits	8 (default)
Data bits trasmission sequence	Least significant bit first
Parity	NONE / ODD / EVEN (NONE default)
Stop Bits	1 / 2 (1 default)

MASTER/SLAVE COMMUNICATION TIMING

Timer Description	Timer Value (msec)
Inter-character time-out	< 1,5 character times
Response delay (from master request)	-
Delay Time (between two master trasmissions)	-

TIME OUT INTERFACE DEVICES

Legrand Device	Time out [ms] (Default)	Programmable
Web Server	1200	YES
Gateway	1000	YES
Interface RS485 / EMS	850	NO
Interface circuit breaker/ EMS	500	NO
Interface RS485 / MODBUS	800	NO

MODBUS PROTOCOL DETAILS

Function Code (HEX)	Exception Codes (HEX)
02 (Read Discrete Inputs)	01, 02, 03
01 (Read Coils)	01, 02, 03
05 / 0F (Write Single / Multiple Coils)	01, 02, 03
04 (Read Input Registers)	01, 02, 03
03 (Read Holding register)	01, 02, 03
06 / 10 (Write Single / Multiple Holding register)	01, 02, 03
Data Encoding	Big Endian (most significant byte first)

MODBUS COMMUNICATION ERROR TABLE

Error Code (hex)	Description
01	Function not implemented
02	Data address not implemented
03	Wrong data value
04	Error in function execution (NACK)
05	ACK for longer operations
06	Device is busy
08	“Memory Parity Error”
0A	Gateway: gateway path unavailable
0B	Gateway: target device failed to response
10*	Session already in the requested state
11*	Checksum Error (Firmware update)
12*	Writing error (Memory total reset)
13*	Wrong packet number
14*	Request of re-sending packet

* internal errors

STRUCTURE

[ADDR] [80h+Function Code] [Error code] [DATA1] [DATA2] [CKS]

NOTE

With error codes 11h, 12h and 13h,
[DATA1] and [DATA2] contain the address of last accepted packet.
If the packet is the first, default value is 0xFFFFFFFF

NUMERIC CODING

DESCRIPTION

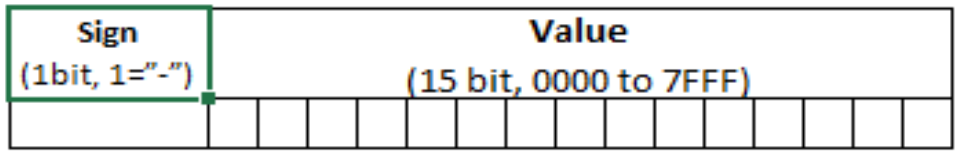
All the registers containing numerical values are expressed as "whole with sign".
Any factors of scale can be indicated in the notes of the mapping together with units of measurement.

CODING

- The most significant bit attributes the sign to the magnitude;
- the remaining bits define the value;
- the significance of the "non-available parameter" (N/A) is attributed to the value corresponding to "0" (zero negative);

The rules indicated above are valid for all the registers regardless of their size (1,2,3 or n-word)

Example 1 word



If the parameter is not available (N/A) the value will be:
1000000000000000b = 0x8000h

"AIR CIRCUIT BREAKER ACB" MAPS AND COMMANDS

Revision of Support maps and Commands
REVISION: 3.0.0
DATE: 29/10/2024

Revision of Support maps and Commands for ACB devices
REVISION: 1.1.2
DATE: 29/11/2024

Product involved:
- DMX^3 1600/2500/4000/6300
- DMX^3 4000 1000V
- DMX-SP 2500/4000

Protection units associated:

PROTECTION UNIT	DESCRIPTION	COMPATIBILITY	OBJECT CODE
LG-028300	MP2.10 integrated LED matrix screen to show electrical values and settings Adjustment via rotating encoder	DMX^3 1600 DMX-SP 2500	0x0008
LG-028301	MP2.10 integrated LED matrix screen to show electrical values and settings Adjustment via rotating encoder With measure function		0x0007
LG-028302	MP4.10 integrated LCD screen for displaying electrical values, settings and log Equipped with batteries for powering in case of mains fault or when the breaker is open or not connected		0x0006
LG-028303	MP4.10 integrated LCD screen for displaying electrical values, settings and log Equipped with batteries for powering in case of mains fault or when the breaker is open or not connected With measure function		0x0005
LG-028304	MP2.10 integrated LED matrix screen to show electrical values and settings Adjustment via rotating encoder	DMX^3 2500 DMX3 4000 DMX^3 4000 1000V DMX^3 6300 DMX-SP 4000	0x0008
LG-028305	MP2.10 integrated LED matrix screen to show electrical values and settings Adjustment via rotating encoder With measure function		0x0007
LG-028306	MP4.10 integrated LCD screen for displaying electrical values, settings and log Equipped with batteries for powering in case of mains fault or when the breaker is open or not connected		0x0006
LG-028307	MP4.10 integrated LCD screen for displaying electrical values, settings and log Equipped with batteries for powering in case of mains fault or when the breaker is open or not connected With measure function		0x0005

RETURN TO TABLE OF MAPS

Read&Write Registers – Modbus Functions 03-06-16

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
144	0090	3	Current date and time		(1),(5)	x

REMARKS:

(1)	**DEFAULT** (0001 010C 0000h) **WORD2:** chronology, “year” (MSB) and “month” (LSB); is the word that is returned first of the threee words – Most significant word **WORD1:** chronology, “day” (MSB) and ”hour” (LSB) **WORD0:** chronology, “minutes” (MSB) and “seconds” (LSB)
(5)	Register value when is not available: 0x800000000000

ADDITIONAL INFORMATION:

Rules are checked every minute and executed starting from rule 1 to rule 10 (1 rule every second).
The rule with the highest ID (1-10) is the last to be executed and then has the highest priority.

[N°2] - Switch Status B (switch Status Functionality) - BASE

RETURN TO TABLE OF MAPS

Read Only Bit - Modbus Function 02

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16384	4000	1	Open		(1)	
16385	4001	1	Closed		(1)	
16386	4002	1	Single tripped switch/ Tripped group of switches		(1),(2)	

REMARKS:

(1)	the information shown here “autorestores” when the condition that has generated it is lost (E.G.: TRIPPED is the faithful response of the device's mechanical contact Where there is a MAN/AUT operating mode selector switch, this notification can only persist if MAN is set);
(2)	if this functionality is used in switch group tripped mode (panel tripped), the bit contains the OR of the tripped of the switches belonging to the group.

Read Only Registers - Modbus Function 04

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16385	4001	1	Intervention Meter (total, cannot be reset at zero by the customer)			x
16386	4002	1	Maximum Manoeuvre Number (cannot be configured by the customer)			x
16387	4003	1	Switch Features – Rated current	[A]	(1)	x
16388	4004	1	Switch features – Type/Poles		(2)	x
16389	4005	1	Switch features – Breaking capacity	[kA]/100	(3)	x

REMARKS:

(1)	RATED CURRENT (numeric coding, [A])
(2)	TYPE/POLES •MSB – DEVICE TYPE bit 0=insulator (0)/int. Automatic (1), bit 1=repulsive switch (0)/ not repulsive switch (1) bit 7-2=“0” •LSB – POLES bit 0 to 3: Number of poles: numeric value (1 to 4) bit 4 Neutral position (left(1)/right(0)) bit 5 :Neutral external (1) (only 3 poles) bit 7-6= “0”
(3)	BREAKING CAPACITY: (numeric coding, [kA/100]. Example: 4,5kA is coded in “hundredths of kA”, therefore 4.5 becomes 450)

[N°3] - Switch Status B + Measure (switch Status Functionality) - BASE

RETURN TO TABLE OF MAPS

Read Only Bit - Modbus Function 02

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

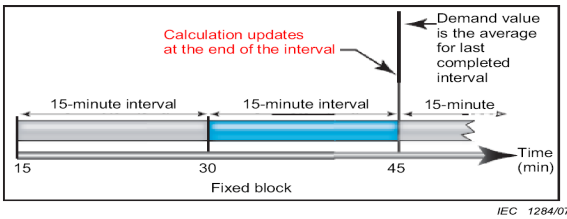
REMARKS:

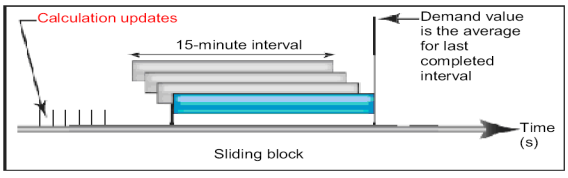
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°5] - 3-Phase Measure E 4P + Measure (Three-phase Electrical Measurement Functionality ("PMD I")) - EVOLVED

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

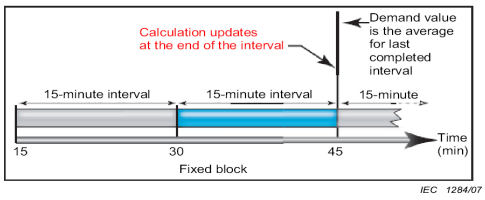
REMARKS:

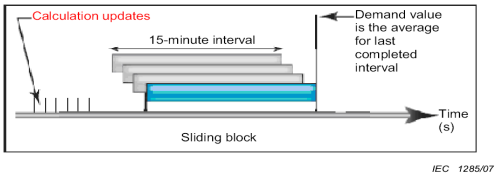
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

29231	722F	1	Alarm P. delayable short-circuit deactivated (Im=10In)			

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

Read Only Bit - Modbus Function 02

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16384	4000	1	Open		(1)	
16385	4001	1	Closed		(1)	
16386	4002	1	Single tripped switch/ Tripped group of		(1),(2)	
16387	4003	1	0		(1)	
16388	4004	1	0		(1)	

REMARKS:

(1)	the information shown here “autorestores” when the condition that has generated it is lost (E.G.: TRIPPED is the faithful response of the device's mechanical contact Where there is a MAN/AUT operating mode selector switch, this notification can only persist if MAN is set);
(5)	if this functionality is used in switch group tripped mode (panel tripped), the bit contains the OR of the tripped of the switches belonging to the group.

Read & Write Bit - Modbus Functions 01-05-15

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16384	4000	1	0			X

Read Only Registers - Modbus Function 04

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16384	4000	1	0x8000			x
16385	4001	1	Intervention Meter (total, cannot be reset at zero by the customer)			x
16386	4002	1	Maximum Manoeuvre Number (cannot			x
16387	4003	1	Switch Features – Rated current	[A]	(1)	x
16388	4004	1	Switch features – Type/Poles		(2)	x
16389	4005	1	Switch features – Breaking capacity	[kA]/100	(3)	x

REMARKS:

(1)	RATED CURRENT (numeric coding, [A])
(2)	TYPE/POLES •MSB – DEVICE TYPE bit 0=insulator (0)/int. Automatic (1), bit 1=repulsive switch (0)/ not repulsive switch (1) bit 7-2="0" •LSB – POLES bit 0 to 3: Number of poles: numeric value (1 to 4) bit 4 Neutral position (left(1)/right(0)) bit 5 :Neutral external (1) (only 3 poles) bit 7-6= "0"
(3)	BREAKING CAPACITY: (numeric coding, [kA/100]. Example: 4,5kA is coded in "hundredths of kA", therefore 4.5 becomes 450)

Read&Write Registers – Modbus Functions 03-06-16

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
16384	4000	1	0x8000		(1)	X

REMARKS:

(1)	bit 0: Open Status active high = 0, input active low = 1 (default = 0) bit 1: Closed Status active high = 0, input active low = 1 (default = 0) bit 2: Tripped Status active high = 0, input active low = 1 (default = 0) bit 3: Alarm on Status Open active = 1, deactivated = 0 (default = 0) bit 4: Alarm on Status Closed active = 1, deactivated = 0 (default = 0) bit 5: Alarm on Tripped Status active = 1, deactivated = 0 (default = 1) bit 15-6 : Not used

[N°2] - 3-Phase Elect Proct S 3P

29231	722F	1	0		(1)	
29232	7230	1	0		(3)	

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(5)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

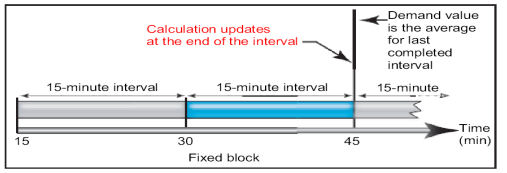
REMARKS:

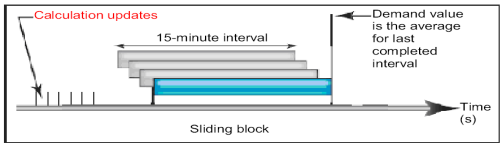
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°4] - 3-Phase Elect Proct S 4P - STANDARD

29232	7230	1	0		(3)	

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

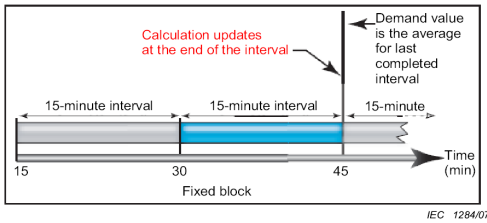
REMARKS:

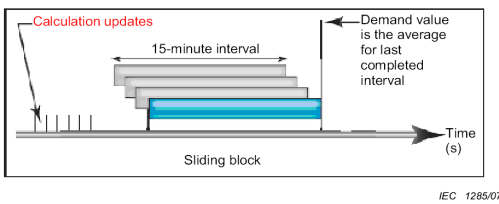
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

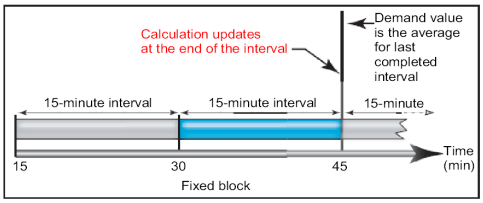
REMARKS:

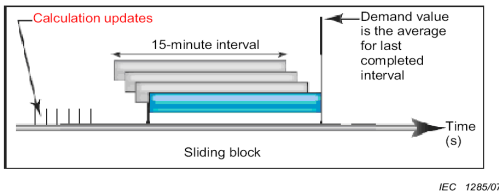
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[7] - 3-Phase Measure M 4P - EVOLVED

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

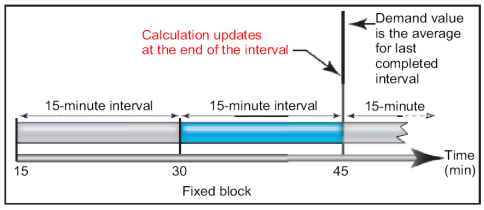
20589	506D	2	0x8000	[kvarh]	(2)	x

REMARKS:

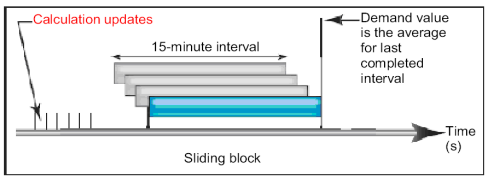
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in "numeric coding"; including sign (most significant bit=sign)
(5)	Expressed in "numeric coding"; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

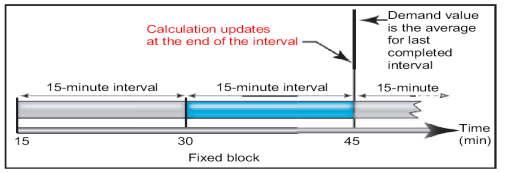
REMARKS:

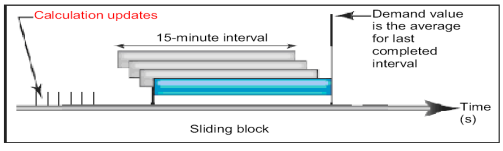
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°4] - 3-Phase Elect Proct S 4P - STANDARD

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in "numeric coding"
(2)	**DATA BUFFER** Last releases: by reading all the ten words the values are returned in the values indicated below •WORD9 : chronology, "year" (MSB) and "month " (LSB); it is the word that is returned first of all in the 10 – MSW block. •WORD8: chronology, "day" (MSB) and "time" (LSB) •WORD7: chronology, "minutes" (MSB) and "seconds" (LSB) •WORD6 and 5: current interrupted or temperature ("numeric coding" , [mA] or [°C], WORD6 is returned before WORD5) •WORD4:detail of protection settings that has caused the Trip (reply read only register of the of the "levels" type, see note (1)) •WORD3: detail of protection settings that has caused the Trip (reply Read Only register of the "Times" type , see note (1)) •WORD2: detail of protection settings that has caused the Trip (reply Read Only register of the "options" type, see note (3)to(6)) •WORD1: reply Read Only Bit of the "Tripped" type •WORD0: reply Read Only Bit of the "Tripped" type **N.B.:** WORDs FROM 2 to 4 constitute a single datum and must be read and written in a block. The same applies to WORD 5 and 6, for WORD 7-8-9 and for WORD 0-1. WORD 1: •Bit0 Instantaneous short-circuit relay tripped neutral •Bit1 Device Protection Relay Tripped phase 1("III element") •Bit2 Device Protection Relay Tripped phase 2 ("III element") •Bit3 Device Protection Relay Tripped phase 3 ("III element") •Bit4 Device Protection Relay Tripped neutral ("III element") •Bit5 Tripped relay in "Main Setting" Mode •Bit6 Tripped relay in "Dual Setting" Mode •Bit7 Tripped relay in "MEM=OFF" Mode on Overload •Bit8 Tripped relay in "I2t=k" mode on delayable short-circuit •Bit 9 Tripped relay in "Logic Selectivity" mode on delayable short-circuit (intervention performed with Tm Delay) •Bit 10 Tripped relay in "Logic Selectivity" Mode on device protection (intervention carried out with with Delay •SEL=High) •Bit 11 Tripped relay in "I2t=k" Mode on earth •Bit 12 Earth leakage Tripped •Bit 13 ND •Bit 14 ND •Bit 15 Test Tripped (if Electronic Test only Bit15, if Earth Lekeage Test Bit15 and Bit12) WORD 0: •Bit0 Overload Tripped relay P. (no indication of phase) •Bit1 Short-circuit Tripped relay P. (no indications of phase) •Bit2 Device Protection Tripped relay ("III element", no indications of phase) •Bit3 Earth Tripped relay P. •Bit4 Overtemperature Tripped relay P. •Bit5 Overload phase 1 Tripped relay P. •Bit6 Overload phase 2 Tripped relay P. •Bit7 Overload phase 3 Tripped relay P. •Bit8 Overload neutral Tripped relay P. •Bit9 Delayable short-circuit phase 1 Tripped relay P. •Bit10 Delayable short-circuit phase 2 Tripped relay P. •Bit11 Delayable short-circuit phase 3 Tripped relay P. •Bit12 Delayable short-circuit neutral Tripped relay P. •Bit13 Instantaneous short-circuit phase 1 Tripped relay •Bit14 Instantaneous short-circuit Tripped relay phase 2 •Bit15 Instant short-circuit phase 3 Tripped relay

(3)	Overload options •Bit0=disabled(1)/active(0) •Bit1=absolute val.(1)/%In(0) •Bit4 to 2=I2t=k MEM OFF(001)/I2t=k MEM ON(000)/Not Defined(111) •Bit7 to 5= "0" •Bit15 to 8=work point for curve I2t, multiple of Ir)
(4)	Delayable short-circuit options •Bit0=disabled(1)/active(0) •Bit1=absolute val.(1)/%Ir(0) •Bit4 to 2=curve t=k(001)/I2t=k(000)/Not Defined(111) •Bit7 to 5= "0" •Bit15 to 8=work point for curve I2t, multiple of Ir)
(5)	Instantaneous short-circuit options •Bit0=disabled(1)/active(0) •Bit1=absolute val.(1)/%In(0) •Bit4 to 2=curve t=k(001)/I2t=k(000)/Not Defined(111) •Bit5= absolute val. divided by 10(1)/absolute value(0) •Bit7 to 6= "0" •Bit15 to 8=work point for curve I2t, multiple of In)
(6)	Device Protection options •Bit0=disabled(1)/active(0) •Bit1=absolute val.(1)/%In(0) •Bit4 to 2= "0" •Bit5= absolute val. divided by 10(1)/absolute value(0)
(7)	Earth Options •Bit0=disabled(1)/active(0) •Bit1=absolute val.(1)/%In(0) •Bit4 to 2=curve t=k(001)/I2t=k(000)/Not Defined(111) •Bit7 to 5= "0" •Bit15 to 8=work point for curve I2t, multiple of Ig)
(8)	Neutral options •Bit0=disabled(1)/active(0) •Bit1="0" (%phase) •Bit4 to 2="0" (curve phase) •Bit7 to 5= "0" •Bit15 to 8="0")
(9)	If number of faults < 20, fill the chronology word with 0x0000

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

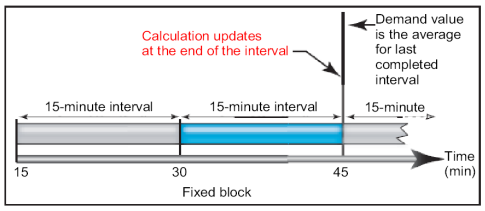
REMARKS:

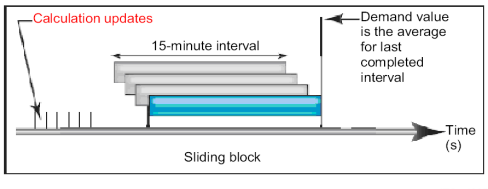
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

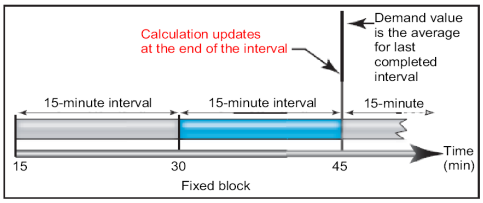
REMARKS:

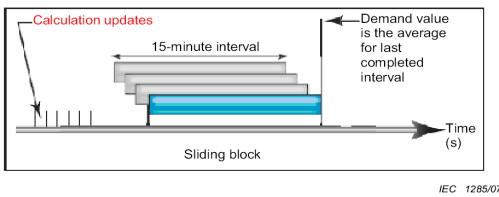
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

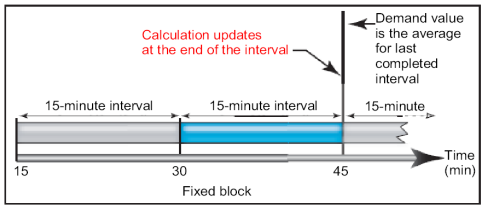
20589	506D	2	0x8000	[kvarh]	(2)	x

REMARKS:

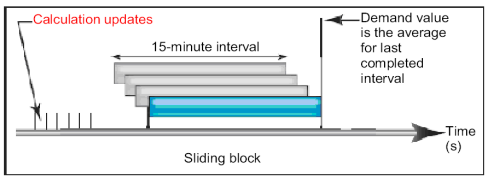
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[8] - Thermal Measurement B - BASE

29232	7230	1	0		(3)	

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

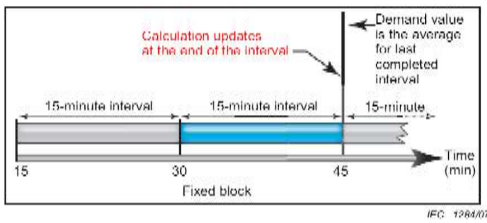
REMARKS:

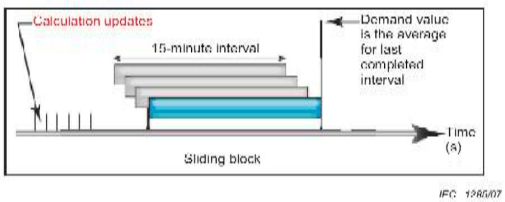
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[11] - 3-Phase Measure E_MD

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

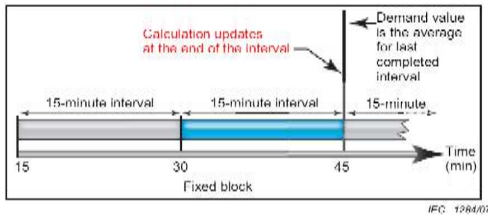
REMARKS:

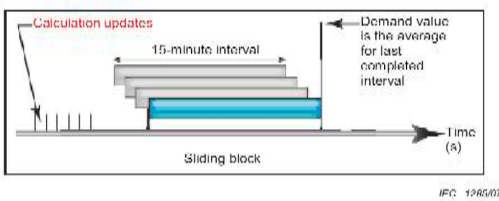
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°12] - Earth leakage Elec. Protec. B

RETURN TO TABLE OF MAPS

Read Only Bit - Modbus Function 02

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
28672	7000	1	Earth leakage Prealarm (>threshold I_1)		(1)	
28673	7001	1	Earth leakage alarm (>threshold I_2)		(1)	
28674	7002	1	0		(1)	
28675	7003	1	0		(1)	
28676	7004	1	Earth leakage P. Tripped relay		(2)	x
28677	7005	1	0		(2)	x

REMARKS:

(1)	The information shown here “autorestores” when the condition that has generated it no longer applies
(2)	The information shown here is retained even when the condition that has generated it no longer applies. the “restore” condition can only be the reading of the device's closed status. It is therefore necessary that the Switch Status Functionality is present; if it is not, the Tripped Relay information MUST NOT BE IMPLEMENTED (E.g.: if the switch is brought back to Open => the Tripped Relay notification must be maintained until the restore condition kicks in)

Read & Write Bit - Modbus Functions 01-05-15

29231	722F	1	0		(1)	
29232	7230	1	0		(3)	

REMARKS:

(1)	The information shown here “restores” itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the “Dual Setting” settings, in particular one or more levels have been found to be greater than the corresponding “Main Setting”.

REMARKS:

(1)	Expressed in “numeric coding”
(2)	DATA BUFFER Last releases: by reading all the ten words the values are returned in the values indicated below •WORD9 : chronology, “year” (MSB) and “month ” (LSB); it is the word that is returned first of all in the 10 – MSW block. •WORD8: chronology, “day” (MSB) and ”time” (LSB) •WORD7: chronology, “minutes” (MSB) and ”seconds” (LSB) •WORD6 and 5: current interrupted or temperature (“numeric coding” , [mA] or [°C], WORD6 is returned before WORD5) •WORD4:detail of protection settings that has caused the Trip (reply read only register of the of the “levels” type, see note (1)) •WORD3: detail of protection settings that has caused the Trip (reply Read Only register of the “Times” type , see note (1)) •WORD2: detail of protection settings that has caused the Trip (reply Read Only register of the “options” type, see note (3)to(6)) •WORD1: reply Read Only Bit of the “Tripped” type •WORD0: reply Read Only Bit of the “Tripped” type N.B.: WORDs FROM 2 to 4 constitute a single datum and must be read and written in a block. The same applies to WORD 5 and 6, for WORD 7-8-9 and for WORD 0-1. WORD 1: •Bit0 Instantaneous short-circuit relay tripped neutral •Bit1 Device Protection Relay Tripped phase 1(“III element”) •Bit2 Device Protection Relay Tripped phase 2 (“III element”) •Bit3 Device Protection Relay Tripped phase 3 (“III element”) •Bit4 Device Protection Relay Tripped neutral (“III element”) •Bit5 Tripped relay in “Main Setting” Mode •Bit6 Tripped relay in “Dual Setting” Mode •Bit7 Tripped relay in “MEM=OFF” Mode on Overload •Bit8 Tripped relay in “I2t=k” mode on delayable short-circuit •Bit 9 Tripped relay in “Logic Selectivity” mode on delayable short-circuit (intervention performed with Tm Delay) •Bit 10 Tripped relay in “Logic Selectivity” Mode on device protection (intervention carried out with with Delay •SEL=High) •Bit 11 Tripped relay in “I2t=k” Mode on earth •Bit 12 Earth leakage Tripped •Bit 13 ND •Bit 14 ND •Bit 15 Test Tripped (if Electronic Test only Bit15, if Earth Lekeage Test Bit15 and Bit12) WORD 0: •Bit0 Overload Tripped relay P. (no indication of phase) •Bit1 Short-circuit Tripped relay P. (no indications of phase) •Bit2 Device Protection Tripped relay (“III element”, no indications of phase) •Bit3 Earth Tripped relay P. •Bit4 Overtemperature Tripped relay P. •Bit5 Overload phase 1 Tripped relay P. •Bit6 Overload phase 2 Tripped relay P. •Bit7 Overload phase 3 Tripped relay P. •Bit8 Overload neutral Tripped relay P. •Bit9 Delayable short-circuit phase 1 Tripped relay P. •Bit10 Delayable short-circuit phase 2 Tripped relay P. •Bit11 Delayable short-circuit phase 3 Tripped relay P. •Bit12 Delayable short-circuit neutral Tripped relay P. •Bit13 Instantaneous short-circuit phase 1 Tripped relay •Bit14 Instantaneous short-circuit Tripped relay phase 2 •Bit15 Instant short-circuit phase 3 Tripped relay

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(5)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

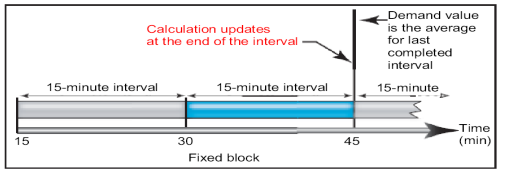
REMARKS:

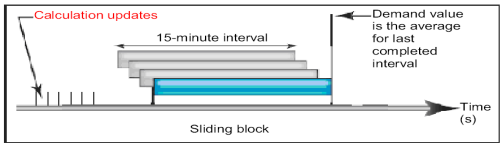
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°4] - 3-Phase Elect Proct S 4P - STANDARD

REMARKS:

(1)	The information shown here "restores" itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the "Dual Setting" settings, in particular one or more levels have been found to be greater than the corresponding "Main Setting".

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

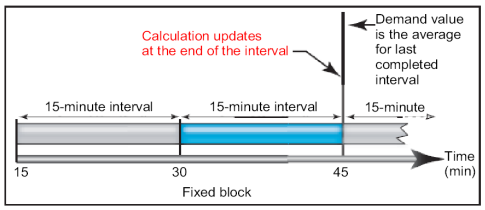
REMARKS:

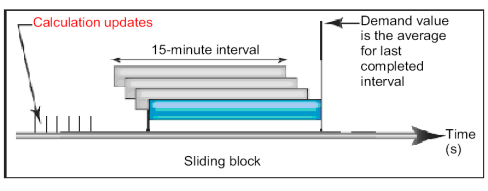
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[6] - 3-Phase Measure E 3P M - EVOLVED

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

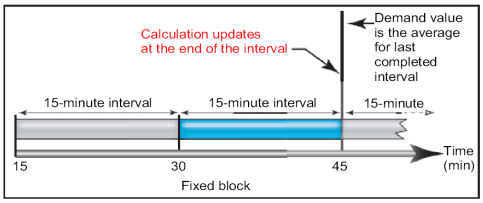
REMARKS:

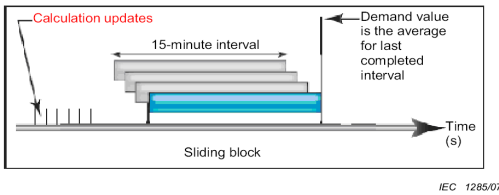
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[7] - 3-Phase Measure E 4P M - EVOLVED

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

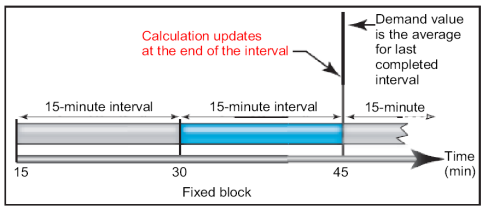
20589	506D	2	0x80000000	[kVarh]	(2)	x

REMARKS:

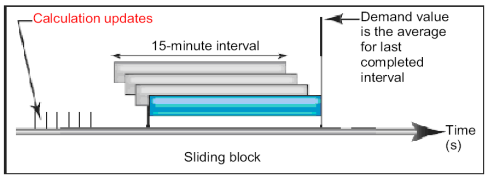
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[8] - Thermal Measurement B - BASE

REMARKS:

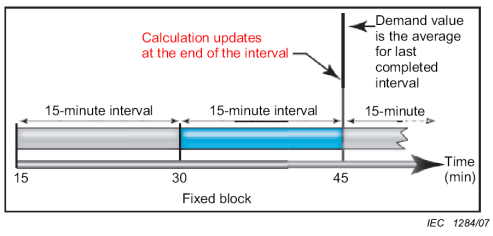
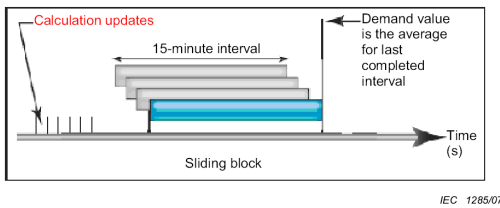
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

Read Only Bit - Modbus Function 02

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply
28672	7000	1	Earth leakage Prealarm (>threshold$_1$)		(1)	
28673	7001	1	Earth leakage alarm (>threshold$_2$)		(1)	
28674	7002	1	0		(1)	
28675	7003	1	0		(1)	
28676	7004	1	Earth leakage P. Tripped relay		(2)	
28677	7005	1	0		(2)	

REMARKS:

(1)	The information shown here “autorestores” when the condition that has generated it no longer applies
(2)	The information shown here is retained even when the condition that has generated it no longer applies. the “restore” condition can only be the reading of the device's closed status. It is therefore necessary that the Switch Status Functionality is present; if it is not, the Tripped Relay information MUST NOT BE IMPLEMENTED (E.g.: if the switch is brought back to Open => the Tripped Relay notification must be maintained until the restore condition kicks in)

Read & Write Bit - Modbus Functions 01-05-15

Address (DEC)	Add. (HEX)	Size	Description	Measurement unit	Remarks	Maintenance without power supply

28680	7008	1	0x8000	[msec]	(2)	x

REMARKS:

(1)	Type: reply Read Only Bit of the "Tripped" type : •bit0=reply of Earth leakage Tripped Relay P. •bit1=reply of Overtemperature Tripped Relay P. •bit15‧2=0
(2)	Expressed as "numeric coding"
(3)	In case of devices that SIMULTANEOUSLY implement Three-Phase and Earth leakage Protection this register MUST NOT BE IMPLEMENTED for the purposes of guaranteeing a unique management of "Last Release data Buffer". the information about the "Earth leakage Protection Tripped Relay", "Overtemperature P. tripped Relay" and relative values in mA or °C is made available in this case in the register of the same name in Three-phase Protection.
(4)	If the value is not available, "negative zero" must be indicated (see numeric coding section)

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

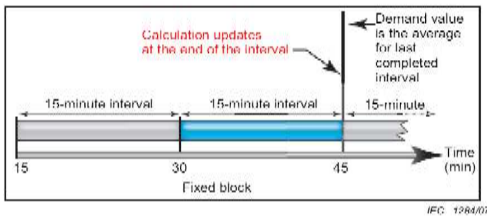
REMARKS:

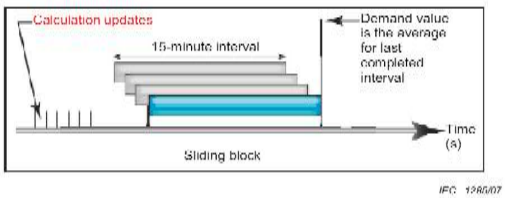
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°12] - 3-Phase Measure E 3P + G M - EVOLVED

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(3)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

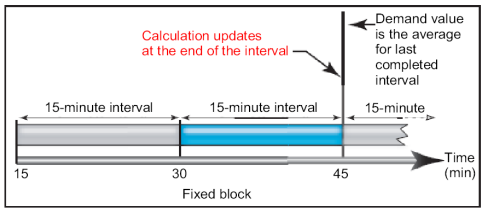
REMARKS:

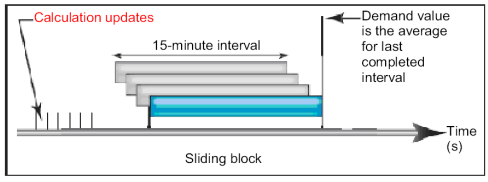
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°13] - 3-Phase Elect Proct S 3P + G - STANDARD

REMARKS:

(1)	The information shown here "restores" itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the "Dual Setting" settings, in particular one or more levels have been found to be greater than the corresponding "Main Setting".

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

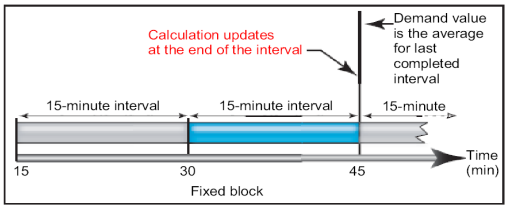
REMARKS:

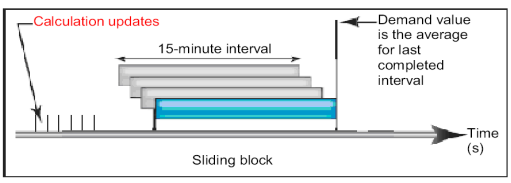
(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



NOTE 15 min is only an example.

[N°15] - 3-Phase Elect Proct S 4P + G - STANDARD

REMARKS:

(1)	The information shown here "restores" itself when the condition that has generated it no longer applies
(2)	The information shown here applies even when the condition generating it has disappeared. the "restore" conditions can be (equivalent, alternatively): •the measurement of the Closed Status of the Device •the measurement of a minimum current value on the phases. The Switch Status Functionality is therefore not binding (Example : if the switch is returned to Open => the Tripped relay notification must be kept until the restore condition kicks in).
(3)	It indicates that an anomaly has been detected in the "Dual Setting" settings, in particular one or more levels have been found to be greater than the corresponding "Main Setting".

REMARKS:

(1)	Expressed in "numeric coding"; including sign (most significant bit=sign)
(2)	Expressed in "numeric coding"; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

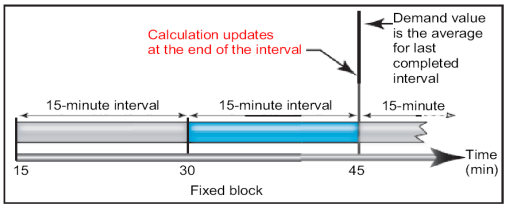
REMARKS:

(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

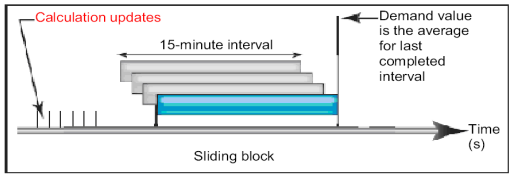
- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



IEC 1284/07

NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



IEC 1285/07

NOTE 15 min is only an example.

REMARKS:

(1)	Expressed in “numeric coding”; including sign (most significant bit=sign)
(2)	Expressed in “numeric coding”; without sign
(3)	Example: PF=0,85, is expressed as 85 (Measurement unit 1/100)
(4)	the value must be divided by the corresponding multiplying factor indicated in the read and write registers, if the register is not present it must be considered as multiplication factor 1 Example: I1 [A] = Phase 1 Current Value (R) / Current multiplication factor = 1023 / 100 = 10.23A

Read&Write Registers – Modbus Functions 03-06-16

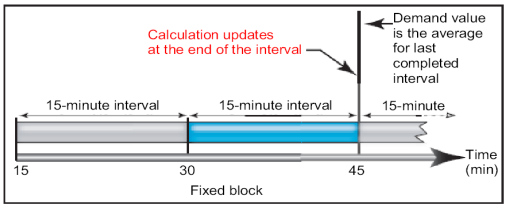
REMARKS:

(1)	Expressed in “numeric coding” with sign (most significant bit=sign)
(2)	Expressed in “numeric coding” with sign (always positive value, most significant bit=0)
(3)	**BYTE1 (MSB)** •“**11**”: system 1V-1I unipolar •“**33**”: system 3V-3I without information on the neutral •“**34**”: system 3V-4I **BYTE0 (LSB)** •“**00**”: if the active power flows in the normal/indicated direction (“upstream to downstream” or in accordance with the polarity indicated for the connection), “default” •“**01**”: if the active power flows in the reverse direction (“downstream to upstream” or vice versa with regard to the polarity indicated for the connection)
(4)	Measurement unit compatible with the magnitude configured to the previous register, multiplied by the reference multiplication factor for that magnitude
(5)	address of the register (absolute value) of the desired magnitude
(6)	**BIT 0** : 1 = The event triggers an alarm, 0 = The event does not trigger the alarm **BIT 1** : 1 = The event generates a Link action, 0 = The event does not generate a Link action **BIT 2** : 0 = alarm activated when value is > of threshold, 1= alarm activated when value is < of threshold
(7)	**BYTE0 (LSB)**: calculation mode •"**0**" (”default”): fixed window or “fixed block interval” •"**1**": mobile window or “sliding block interval” **BYTE1 (MSB)**: calculation window (value in [sec], 1 to 60, “default”=15)

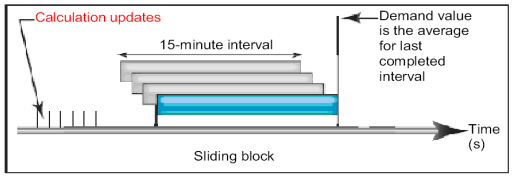
- fixed block interval: the intervals are consecutive; the PMD calculates and updates the demand at the end of each interval;



IEC 1284/07

NOTE 15 min is only an example.

- sliding block interval: the intervals are sliding; the PMD calculates and updates the demand at the sliding speed.



IEC 1285/07

NOTE 15 min is only an example.
